Download NIRA PC Game Free ?The present invention relates to a disposable syringe and more particularly to a hypodermic syringe which can be used safely even with a highly contaminated needle. Conventionally, most hypodermic syringes have metal needles. Such needles are expensive and need to be disposed of after use. Additionally, because the syringe body and the needle are made of different materials, corrosion can form at the junction of the needle and the syringe body and may cause failure of the needle in the syringe body. In use, a medical or dental practitioner will cleanse a contaminated needle prior to disposing of it. Because such a practice is hazardous in that there is a risk of accidental contact with a previously used needle, syringes have been proposed with needle shields or ports to minimize such risks. Disposable hypodermic syringes have been proposed which can be used multiple times with different needles as a means of promoting sterilization and prevention of accidental needle stick injuries. In order to obtain maximum effectiveness from a syringe, it is desirable that there be very little dead volume in the syringe, because dead volume occupies volume above the reservoir of drug to be injected. Although an ideal syringe will have no dead volume, in practice, a small dead volume cannot be avoided. It is therefore desirable that any such dead volume not take up the space of an injected dose. The volume of the dead space in a syringe is ideally zero, but in practice it must be small and preferably within the tolerance of the drug to be injected. The concept of replacing a needle with a second needle of the same length is not new. In some designs a second, longer needle has been inserted in the central bore of a syringe body with the second needle extending to the tip of the syringe and projecting outwardly to be used in an injection. In such designs, use of the needle is possible only by breaking and removing the original needle to obtain access to the second needle, which is then replaced. There are two additional difficulties which limit the use of such dual needle syringes. The first is the difficulty of forming a needle with a large tolerance. A second problem is that one must somehow replace the old needle with the new needle in an injection without damaging the syringe and its plunger. A final difficulty with such designs is that the length of the needle inserted is not automatically related to the length of the original needle, and therefore it is necessary for
